A sustainable practice in Singapore is to be driven by:

1. A greener practice guided by the new 7 EDGs (Environmental Design Goals), which draw its origins from the UN SDGs (Sustainable Development Goals) and the prior 11 Attributes.
2. The SIA Green Book, which guides architectural practice along these 7 EDGs, across the life cycle and value chain of practice.
3. A resource-conscious Circular Economy plan, which looks at how waste can be recycled into the value chain.
4. The Built Environment industry-level ITM (Industry Transformation Map), in close collaboration with the government boards.
